

NeuroPress v2 inside Clio: how far each chunk's stored setting is from that chunk's best

Regret = cost of the stored setting / cost of the chunk's cheapest setting - 1, from the sweep's measurements of all 45 settings on that chunk (cost = compress + decompress + bytes at 1 GB/s). 0% = the best setting was stored (green ticks). The sweep's times are ~1.8x faster than Clio's, so this best is the sweep's best, not necessarily Clio's.
