

NeuroPress v2 inside Clio: the codec setting chosen for each chunk

Top row: the cheapest setting by the sweep's measurements (compress + decompress + bytes at 1 GB/s). Colour = codec; lighter = byte shuffle, darker = bit shuffle.
Clio's own timings are $\sim 1.8\times$ the sweep's, so a learning run that adapts to them can differ from the top row and still be right for Clio.

VPIC: setting stored for each chunk

Nyx: setting stored for each chunk
